

KAMPUNG SG · GAME TRACK

Every Small Act Grows the Kampung.

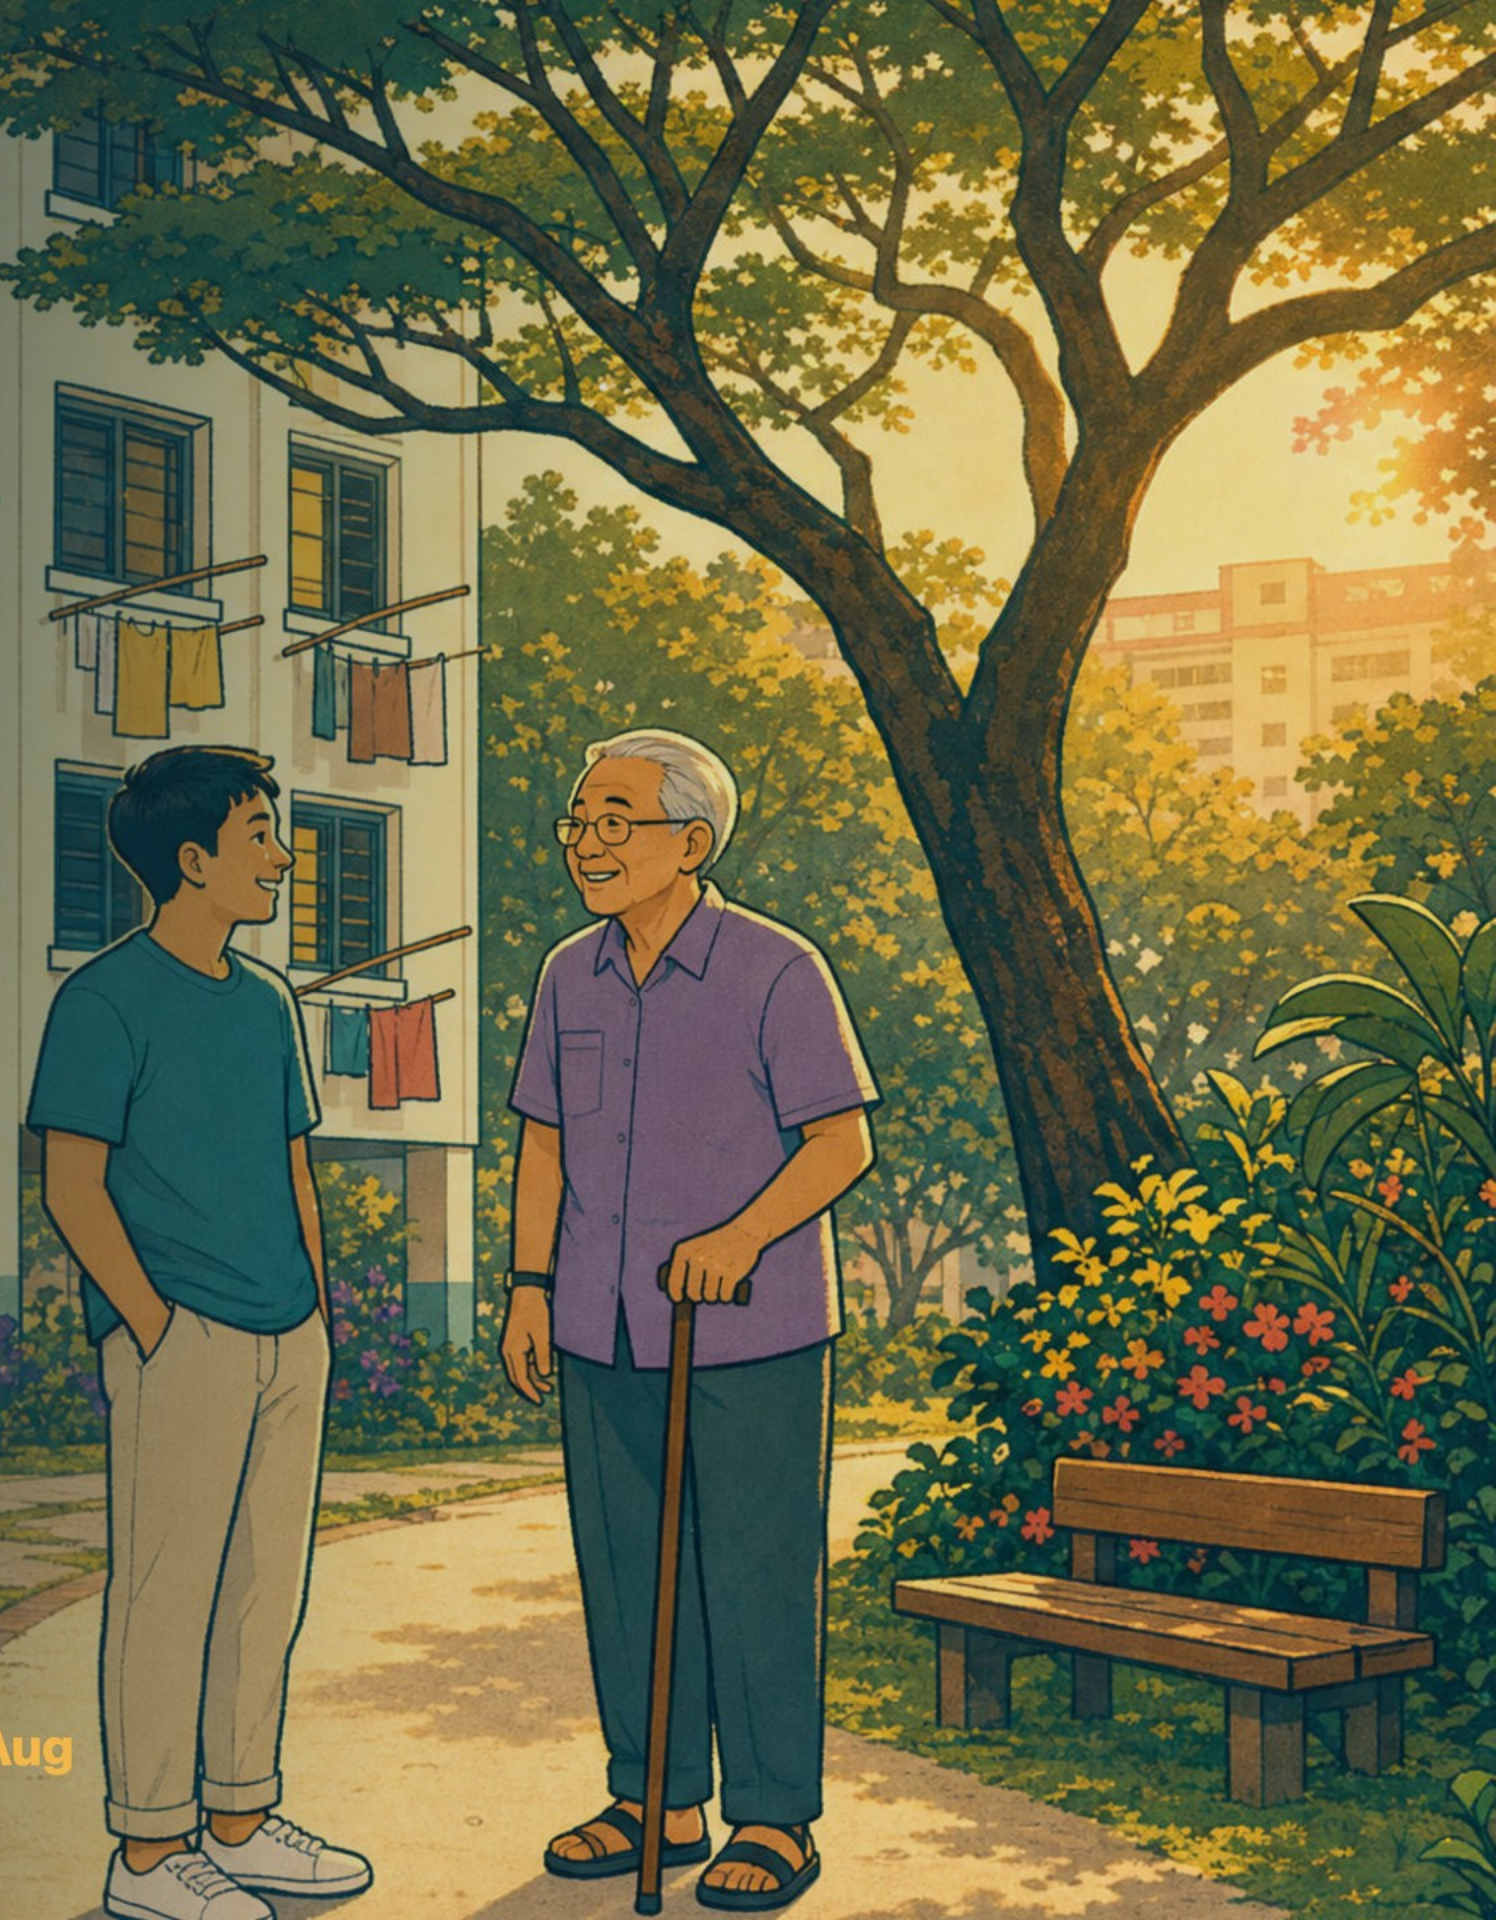

A cozy five-part campaign where older residents are the experts shaping an enterable Singapore estate.

Prologue + 3 chapters + ending

Enter homes and landmarks

NPCs remember your choices

THE PROBLEM

One in four, by 2030.

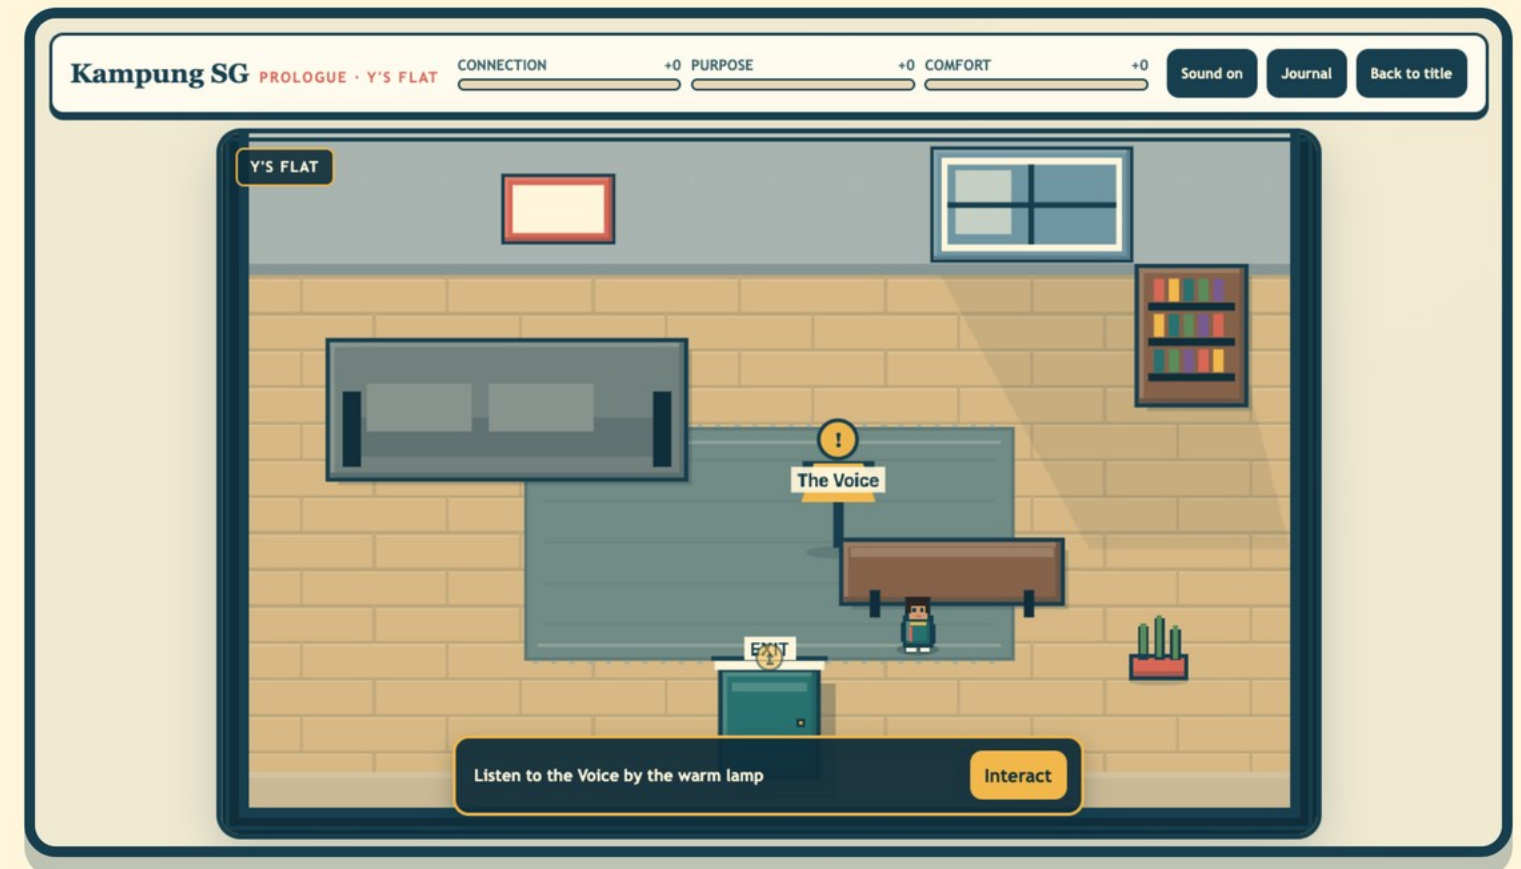

1 in 4

Singapore citizens will be aged 65+ by 2030

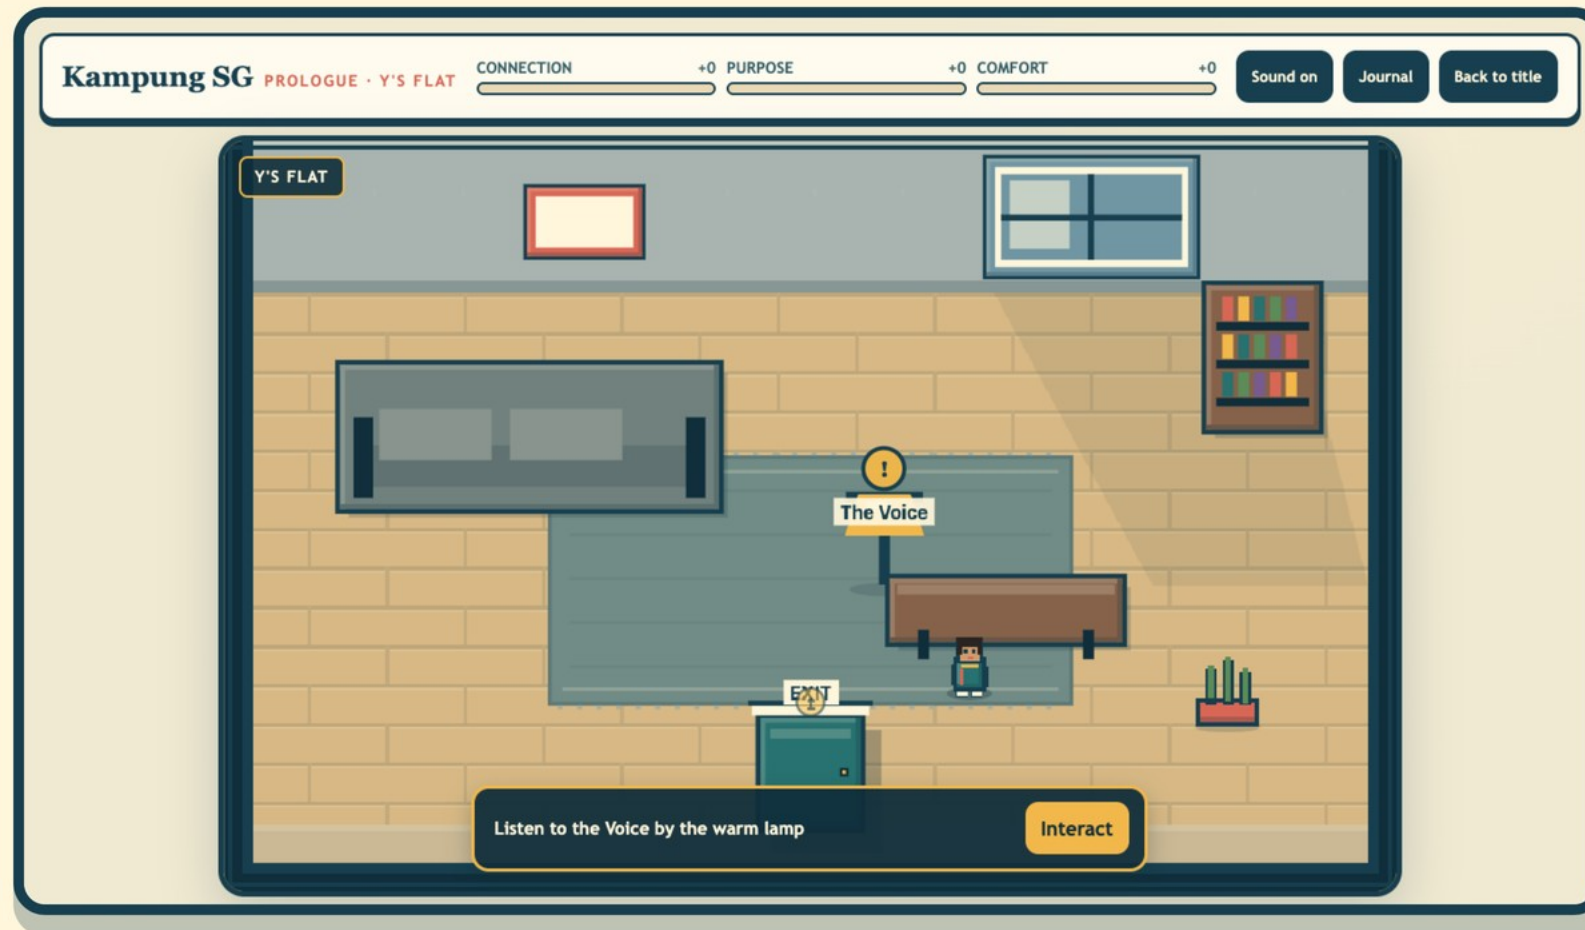

- Age Well means dignity, purpose, independence, social bonds
- The gap is belonging — not supervision
- We design for contributors, never for patients

Verbatim, p.5: "By 2030, nearly one in four citizens will be aged 65 and above."

Source: **"AI CAN DO IT" — "Age Well" Social Good Challenge Singapore**, official hackathon brief (2026), p.5.

Five doors tell one connected story.

- Prologue, three sequential chapters, one ending, then free exploration
- 2560×1600 estate plus homes, corridor, workshop, shops and halls
- Move with WASD, arrow keys, or the on-screen touch pad
- Recruit 3 helpers, invite 5 residents, reconnect Ben with a craftsman
- Every meaningful interaction has an equivalent Journal action
- No timer. No energy bar. No failure state.

1. Enter

Homes and landmarks carry resident-specific details

KAMPUNG SG · THETWOGUYS

2. Listen

KampungMind selects authored intent from context

3. Remember

Choices persist in people, places and the estate

Eight routes. One private KampungMind.

COMMUNITY GARDEN

Aunty Mei

Tropical herb care. She decides what the estate grows, and teaches younger neighbours when to harvest.

VOID-DECK NOTICEBOARD

Uncle Ravi

The void-deck host. He turns a board full of notices into an invitation, and welcomes chess beginners.

SHADED ROUTE

Mdm Siti

Route expert. She maps sun and rain exposure from walking it daily, and her knowledge drives the shelter plan.

- Personality, role, expertise, knowledge and memory rules per NPC
- Authored greetings, clues, requests, reminders and reflections
- Deterministic scoring; stable IDs break ties; no runtime generation

"A full table begins with one invitation that does not test anybody."
— **Uncle Ravi, remembered reflection. In-game, verbatim.**

How AI built this, honestly.

Every team will say their AI tool worked great. Ours didn't — the first time. That is why we can show you a verification gate instead of a promise.

AI PRODUCED	WHAT OUR GATE CAUGHT	WHAT WE DID	VERIFIED AFTER
CodeBuddy CLI 2.127.0 authored the first 10 files, including the match engine that still ships today	Overran its 50-turn limit. 2 TypeScript errors · 3 failing tests · 1 unused dependency · 4 audit findings · 1 stale-timer race	Rewrote tests off an invalid constant-RNG shuffle assumption; added session-aware timer cancellation	tsc clean · 75/75 tests · 0 vulnerabilities · 60/60 browser smoke

CodeBuddy's retry returned **429 Credits exhausted**; we preserved the failure. A later **OpenAI image-generation pass** produced one style key. Humans rejected direct runtime use and translated its best idea into four verified code-drawn activity vignettes.

AI visual target · exact prompt + output preserved

Human-curated playable result · swept, tended, talked

Fast, private, tested, no backend.

BYTES COLLECTED

- Vite + TypeScript + Phaser 3, strict mode throughout
- Engine lazy-loads only after "Begin" — matters on an older phone
- 60-check Chrome DevTools smoke test drives full and demo campaigns
- Keyboard, touch, or Journal shortcuts — each alone completes the game
- No account, no analytics, no backend, no personal data
- All audio synthesised at runtime — zero audio files shipped

A COZY SINGAPORE NEIGHBOURHOOD
SANDBOX

TENCENT CLOUD HACKATHON

Kampung

KampungMind stays private and offline. Dialogue is authored ahead of time and selected by deterministic, unit-tested code — zero network calls, API cost or runtime hallucination.

What we tested. What we won't claim.

What we can support

- ✓ Strict TypeScript, 75 passing tests, 0 vulnerabilities
- ✓ 60/60 production-browser checks across full and demo campaigns
- ✓ Keyboard and touch entry, focus return and correct return doors
- ✓ No data collection, no account, no network dependency
- ✓ Versioned autosave, Continue, confirmed Start Over and demo isolation

What we deliberately do not claim

- Any cognitive, memory, or dementia benefit
- Any clinical or health outcome
- Any measured user or population result
- Any claim about what this does for a real person's life

We wrote our claim guardrails **before** we wrote the game. Kampung SG does not diagnose, measure, prevent, delay, or treat anything. On a health-adjacent topic, that restraint **is the design** — not a limitation of it.

Engine: Phaser 3 (MIT). **Build:** Vite, TypeScript, Vitest (MIT).

Audio: synthesised at runtime with the Web Audio API. No third-party audio files, no licence obligations.

Art: in-game — procedural Phaser geometry, including four human-curated activity vignettes informed by a real OpenAI image-generation pass. Style-key prompt, output and review: **docs/prompts/openai-neighbourhood-style-key.txt**. This is not claimed as Miora.

Ageing statistic: official "AI CAN DO IT" — "Age Well" Social Good Challenge Singapore hackathon brief.

AI assistance: CodeBuddy CLI 2.127.0 and AI coding agents under human direction. Full record, including the failed run, in **docs/AI_USAGE_LOG.md**.

Kampung SG is an original work. It does not copy any existing game's art, characters, maps, or branding.
