

KAMPUNG SG · GAME TRACK

Every Small Act Grows the Kampung.

A cozy Singapore neighbourhood sandbox where older residents are the experts — not the errands.

Walk one HDB estate

Join small invitations

The estate visibly changes

THE PROBLEM

One in four, by 2030.

1 in 4

Singapore citizens will be aged 65+ by 2030

- Age Well means dignity, purpose, independence, social bonds
- The gap is belonging — not supervision
- We design for contributors, never for patients

Verbatim, p.5: "By 2030, nearly one in four citizens will be aged 65 and above."

Source: **"AI CAN DO IT" — "Age Well" Social Good Challenge Singapore**, official hackathon brief (2026), p.5.

A place, not a menu.

- 1600×1000 estate: HDB block, void deck, hawker corner, garden
- Move with WASD, arrow keys, or the on-screen touch pad
- Approach a resident, press E, choose together
- Three meters rise: Connection, Purpose, Comfort
- Any three activities unlock the evening reflection
- **No timer. No energy bar. No failure state.**

1. Walk

Discover activities in any order you like

2. Choose

Both options are valid preferences

3. The world changes

Your choice appears in the estate

THE RESIDENTS

Three neighbours with real expertise.

COMMUNITY GARDEN

Aunty Mei

Tropical herb care. She decides what the estate grows, and teaches younger neighbours when to harvest.

VOID-DECK NOTICEBOARD

Uncle Ravi

The void-deck host. He turns a board full of notices into an invitation, and welcomes chess beginners.

SHADED ROUTE

Mdm Siti

Route expert. She maps sun and rain exposure from walking it daily, and her knowledge drives the shelter plan.

- Two choices each — preferences, never right answers
- Six choices, six visible changes in the estate
- Residents greet you; their lines change after you act

"Two neighbours signed up while you were walking around."

— Uncle Ravi, after your choice. In-game, verbatim.

How AI built this, honestly.

Every team will say their AI tool worked great. Ours didn't — the first time. That is why we can show you a verification gate instead of a promise.

AI PRODUCED	WHAT OUR GATE CAUGHT	WHAT WE DID	VERIFIED AFTER
CodeBuddy CLI 2.127.0 authored the first 10 files, including the match engine that still ships today	Overran its 50-turn limit. 2 TypeScript errors · 3 failing tests · 1 unused dependency · 4 audit findings · 1 stale-timer race	Rewrote tests off an invalid constant-RNG shuffle assumption; added session-aware timer cancellation	tsc clean · 59/59 tests · 0 vulnerabilities · 19/19 browser smoke

When we asked CodeBuddy to fix its own output, the account returned **429 Credits exhausted**. We did not buy credits, and we did not invent extra runs to make this slide look better. **We treat AI output as a pull request, not a deliverable.**

Human decided: that residents are experts not quest problems; the no-medical-claims policy, written before any code; non-punitive choices.

AI produced: the Phaser world, movement, collision, camera and HUD; the deterministic domain logic and its 59 tests; the Web Audio synthesis layer.

Fast, private, tested, no backend.

VOID DECK

Ah, a new face. Help me decide
what goes on the board?

Uncle Ravi

What we tested. What we won't claim.

What we can support

- ✓ Strict TypeScript, 59 passing tests, 0 vulnerabilities
- ✓ 19/19 production-browser checks, including a second playthrough
- ✓ Completable by keyboard, touch, or Journal shortcuts alone
- ✓ No data collection, no account, no network dependency
- ✓ Evening reflection built from the player's real choices

What we deliberately do not claim

- Any cognitive, memory, or dementia benefit
- Any clinical or health outcome
- Any measured user or population result
- **FILL: human playtest findings, or state "no human playtest yet"**

We wrote our claim guardrails **before** we wrote the game. Kampung SG does not diagnose, measure, prevent, delay, or treat anything. On a health-adjacent topic, that restraint **is the design** — not a limitation of it.

Guardrails: [docs/RESEARCH.md](#) · Consent & privacy protocol: [docs/PLAYTEST_PROTOCOL.md](#) · Full AI record: [docs/AI_USAGE_LOG.md](#)

[ming3465.github.io/
Tencent-Hackathon-9Aug](https://ming3465.github.io/Tencent-Hackathon-9Aug)

Engine: Phaser 3 (MIT). **Build:** Vite, TypeScript, Vitest (MIT).

Audio: synthesised at runtime with the Web Audio API. No third-party audio files, no licence obligations.

Art: procedural Phaser geometry, authored by the team. No third-party art assets ship in this build.

Ageing statistic: official "AI CAN DO IT" — "Age Well" Social Good Challenge Singapore hackathon brief.

AI assistance: CodeBuddy CLI 2.127.0 and AI coding agents under human direction. Full record, including the failed run, in [docs/AI_USAGE_LOG.md](#).

Kampung SG is an original work. It does not copy any existing game's art, characters, maps, or branding.
